1. INTRODUCTION — THE PIN (BEGINNER LEVEL)

What Is Breakout Indicator Bot?

Breakout Indicator Bot is a professional-grade, browser-based trading indicator built specifically for the **Deriv platform**. It connects live to Deriv's price feeds and continuously watches charts for high-quality trading opportunities across dozens of markets — 24 hours a day, 7 days a week.

Think of Breakout Indicator Bot as your personal market analyst who never sleeps. While you go about your day, it is scanning every candlestick, measuring every price move, and

alerting you the moment a quality setup forms. You remain in full control of your trades — Breakout Indicator Bot gives you the information; you make the decisions.

It is accessed through your web browser at: trading.dsitservicesja.com/indicator/

What Does Breakout Indicator Bot Do?

Breakout Indicator Bot:

- **Connects live to Deriv** via a secure WebSocket and receives real-time price data
 - **Monitors candles in real time** across every timeframe from 1 minute to 1 day
 - **Identifies 6-phase breakout-retest setups** — the core signal engine
 - **Runs up to 12 additional strategies simultaneously** on the same chart
 - **Fires a Live Scalp Scanner** for rapid, high-confluence short-term entries
 - **Alerts you via Telegram** with a full chart screenshot, entry, stop loss, and take profit
 - **Optionally places trades automatically** on your Deriv account when a signal fires
 - **Tracks your win/loss record** and displays live performance statistics
 - **Can be backtested** using historical candle data
-

Markets Breakout Indicator Bot Analyses

Breakout Indicator Bot supports over 90 symbols across the following categories:

Category	Available Markets
Volatility (1s)	Vol 10, 15, 25, 30, 50, 75, 90, 100, 150, 200, 250, 300 (1s)
Volatility (Standard)	Vol 10, 25, 50, 75, 100 Index
Boom Indices	Boom 300, 500, 600, 900, 1000
Crash Indices	Crash 300, 500, 600, 900, 1000
Jump Indices	Jump 10, 25, 50, 75, 100

Category	Available Markets
Step Indices	Step Index, Step 200, 300, 400, 500
Daily Reset	Bull Market Index, Bear Market Index
DEX Indices	DEX 600/900/1500 Up and Down
Drift Switch	Drift Switch 10, 20, 30
Forex Majors	EUR/USD, GBP/USD, USD/JPY, USD/CHF, AUD/USD, USD/CAD, NZD/USD
Forex Crosses	EUR/GBP, EUR/JPY, GBP/JPY, and 14 more pairs
Forex Exotics	USD/MXN, USD/ZAR, USD/TRY, and 5 more
Commodities	Gold (XAU/USD), Silver (XAG/USD), Platinum, Palladium

All Deriv synthetic indices are available 24/7, including weekends. Forex markets follow standard market hours.

Timeframes Available

Breakout Indicator Bot can run on any of these timeframes: **1m, 2m, 3m, 5m, 10m, 15m, 30m, 1h, 2h, 4h, 8h, 1D**

The best timeframe depends on your trading style and the market you are trading (explained further in Sections 3 and 5).

What Are "Potential Trade Setups"?

When Breakout Indicator Bot identifies a setup, it means:

- A defined sequence of price conditions has been satisfied
- The technical evidence suggests the market **may** move in a specific direction
- The risk-to-reward on the setup meets a minimum standard
- There is **always a possibility the trade does not work** — no setup is certain

Think of it like a weather forecast: "70% chance of rain." The meteorologist uses the best available data to give you a probability — not a guarantee.

Who Is Breakout Indicator Bot For?

Trader Type	How Breakout Indicator Bot Helps
Complete Beginner	Provides structured, explained setups as a learning guide
Scalper	Live Scalp Scanner fires rapid entries on 1m-5m charts
Intraday Trader	Core breakout-retest signals on 15m-1h charts
Swing Trader	Higher-timeframe signals (4h, Daily) on Forex pairs
Busy Professional	Telegram alerts mean you never have to watch the screen
Advanced Trader	12 strategies and deep filter controls for precision execution
Auto-Trader	Optional auto-execution on your Deriv account

What Breakout Indicator Bot Does NOT Do

- Does not guarantee profits — no indicator, system, or analyst can do that
 - Does not replace your risk management — stop loss and lot size remain your responsibility
 - Does not constitute financial advice — setups are technical signals only
 - Does not place trades automatically unless you enable Auto-Trade and accept the associated risk
 - Is not responsible for losses — you are the trader and final decision-maker
-

Subscription Plans

Breakout Indicator Bot is a subscription service. Plans are available as follows:

Plan	Price	Duration	Access
Trial	Free	Limited	Basic signals, demo trading only
Weekly	\$9.99	7 days	All 12 strategies, live and demo trading, Telegram alerts
Monthly	\$29.99	30 days	All 12 strategies, live and demo trading, Telegram alerts, priority support

Contact your administrator to activate a plan. Subscription access is enforced at login.

2. HOW THE INDICATOR WORKS (BEGINNER TO INTERMEDIATE)

The Core Engine: 6-Phase Breakout-Retest Cycle

The heart of Breakout Indicator Bot is a 6-phase process that plays out on every chart, on every candle. Understanding these six phases is the most important thing you can learn about this indicator.

Phase 1 — RANGE

The indicator watches the first group of candles and measures the **opening range** — the high and low price established during the initial period (configurable, default 15 minutes).

Think of this as the "base camp" — a zone where price has been consolidating before making its next move. The range high and range low are drawn on the chart as reference lines.

Example: On V75 (1m), Breakout Indicator Bot collects the first 15 one-minute candles and marks the high and low of that period.

Phase 2 — BREAKOUT

The indicator waits for a candle to **close** above the range high (bullish breakout) or below the range low (bearish breakout). A wick through the level that closes back inside is **not** counted — the candle body must close outside.

This is important: Breakout Indicator Bot requires a **confirmed close** outside the range, not just a temporary spike. This filters out false moves.

Example: A strong bullish candle closes above the range high. Breakout confirmed, direction set to BUY.

Phase 3 — RETEST

After a breakout, price almost always pulls back to **retest** the level it just broke through. The breakout level becomes new support (after a bullish break) or new resistance (after a bearish break).

Breakout Indicator Bot monitors for this retest using ATR-based tolerance so that minor wicks above or below the level do not count as a failed retest.

Example: After the bullish breakout, price pulls back down toward the range high. Breakout Indicator Bot detects that price has touched the retest zone.

Phase 4 — INDECISION

At the retest zone, the indicator looks for a **candlestick pattern that shows the market pausing** — buyers and sellers fighting for control. Breakout Indicator Bot detects the following indecision patterns:

Pattern	Description
Doji	Open and close nearly identical — neither side winning
Spinning Top	Small body with wicks on both sides
Pin Bar / Hammer / Shooting Star	Long tail in one direction — rejection of a price level
Inside Bar	Current candle fully inside the previous candle's range
Dragonfly Doji	Long lower wick, open/close near high — bullish rejection
Gravestone Doji	Long upper wick, open/close near low — bearish rejection

Example: A pin bar with a long lower tail forms at the retest zone — sellers tried to push lower but buyers rejected it.

Phase 5 — CONFIRMATION

The indecision candle alone is not enough. Breakout Indicator Bot requires a **confirmation candle** that shows momentum is genuinely entering in the direction of the trade.

Confirmation patterns include:

Pattern	What It Means
Bullish Engulfing	A green candle that completely engulfs the previous red candle — strong buying momentum
Bearish Engulfing	A red candle that completely engulfs the previous green candle — strong selling momentum
Morning Star	A 3-candle reversal pattern signalling the end of a downtrend
Evening Star	A 3-candle reversal pattern signalling the end of an uptrend
Inside Bar Breakout	The inside bar's range is broken in the trade direction
Piercing Line / Dark Cloud Cover	Mid-body penetration patterns showing momentum shift

Pattern	What It Means
Tweezers Tops / Bottoms	Two candles with matching highs or lows — double rejection

Phase 6 — TRADE

When confirmation fires, Breakout Indicator Bot calculates and displays the full trade setup:

- **Entry price** — the close of the confirmation candle
- **Stop Loss** — anchored to the lowest low (bullish) or highest high (bearish) of the retest zone candles, with an ATR buffer for breathing room
- **Take Profit** — calculated from your chosen Risk:Reward ratio
- **Confluence Score** — an overall quality rating for the setup (0-16 points)
- **Position Size** — calculated automatically if you enter your account balance and risk percentage

The signal is then sent to Telegram and displayed on the live chart.

Confluence Score (0-16)

Every breakout-retest signal is scored from **0 to 16** based on how many quality conditions are met. The higher the score, the stronger the setup. Factors that contribute to the score include:

- EMA 8/21 alignment with trade direction
- Higher-timeframe EMA 100 alignment
- Strong breakout candle (body conviction)
- Pin bar present at retest
- Support/Resistance confluence
- RSI at ideal retest level
- Volume spike on breakout
- Session timing
- Fibonacci level at retest

- MACD momentum alignment
- Bollinger Bands squeeze
- ADX trend strength
- Stochastic momentum

A confluence score of **8 or higher** is generally considered a strong, high-quality setup.

Live Ticker Banners

The top of the Breakout Indicator Bot screen shows three live scrolling banners:

- **LIVE SIGNALS** — breakout-retest signals
- **LIVE SCALPS** — scalp scanner alerts
- **STRATEGIES** — alerts from the 12 strategy modules

Technical Indicators Running in the Background

Breakout Indicator Bot continuously computes the following indicators on every candle:

Indicator	Purpose
EMA 8 and 21	Short-term trend direction and crossover filter
EMA 100	Higher-timeframe trend proxy
EMA 200	Long-term structural trend reference
ATR (14)	Measures volatility — used for SL placement, tolerance, and trailing stops
RSI (14)	Confirms pullback depth at retest; oversold/overbought conditions
MACD (12/26/9)	Momentum filter — is momentum aligning with the trade?
Bollinger Bands (20/2 std dev)	Detects squeeze — low volatility before a big move

Indicator	Purpose
ADX (14)	Measures trend strength (25+ = trending; below 20 = ranging)
Stochastic (14/3/3)	Secondary momentum filter — K/D crossovers
VWAP	Volume-weighted average price — institutional bias level
Fibonacci Levels	23.6%, 38.2%, 50%, 61.8%, 78.6% retracement levels at retest

The 6-Phase in Action — Full Example

Market: Volatility 75 (1s) | **Timeframe:** 1 Minute

Phase 1 (RANGE): Breakout Indicator Bot collects 15 candles and marks the range: high at 12,450, low at 12,430.

Phase 2 (BREAKOUT): A strong green candle closes at 12,458 — above the 12,450 range high. Breakout direction: BUY.

Phase 3 (RETEST): Price pulls back. Breakout Indicator Bot detects that the current candle touched 12,451 — inside the ATR tolerance zone of the 12,450 level.

Phase 4 (INDECISION): A pin bar forms with a long lower wick at 12,449. Tail is 2.5x the body — confirmed pin bar.

Phase 5 (CONFIRM): The next candle is a strong bullish engulfing candle closing at 12,455.

Phase 6 (TRADE): Entry: 12,455. SL: 12,441 (swing low + ATR buffer). TP: 12,483 (2:1 RR). Confluence Score: 11/16. Telegram alert sent with chart screenshot.

3. HOW TO USE BREAKOUT INDICATOR BOT (CORE USAGE)

The Interface at a Glance

When you open Breakout Indicator Bot in your browser, you will see:

Top bar (always visible):

- Brand name + connection status badge
- Account type (Demo or Real)
- Current phase (RANGE, BREAKOUT, RETEST, INDECISION, CONFIRM, TRADE)
- Breakout direction
- Live price
- Candle countdown timer (turns red when under 10 seconds)
- Candles processed count
- Session uptime
- Win rate %
- Connect / Disconnect / Reset buttons
- Tool buttons: Export CSV, Export PDF, Theme, Sound, Notifications, Stream Mode

Left Panel (tabbed):

- **Settings** — API credentials, symbol, timeframe, strategies, filters, auto-trade
- **State** — live indicator values (EMA status, HTF trend, ATR, RSI, MACD, etc.)
- **Stats** — win/loss count, win rate, signal history

Centre — Live Chart: Candlestick chart with EMAs, range lines, signal markers, and overlays drawn in real time.

Step 1 — Connect to Deriv

1. In the **API** section of the Settings tab, enter your **Deriv App ID** (default is provided)
2. Paste your **Deriv API Token** (create one at app.deriv.com under API Token)
3. Click the **Connect** button in the top bar (or press **Alt+C**)
4. The status badge changes from DISCONNECTED to CONNECTED and the account type badge shows Demo or Real

Tip: Keep your API token secure. Breakout Indicator Bot stores it encrypted in your browser's local storage.

Step 2 — Choose Your Market and Timeframe

In the **Market** section:

1. Select your **Symbol** from the dropdown (e.g. Volatility 75 (1s), EUR/USD, Boom 1000)
2. Select your **Timeframe** (e.g. 1m for scalping, 15m for intraday, 1h for swing)
3. Breakout Indicator Bot automatically applies **recommended settings** for the selected symbol

Lock features: Tick the Lock checkbox next to Timeframe or R:R to prevent them from being overridden when you switch symbols.

Step 3 — Configure Your Risk:Reward

In the **Risk : Reward** section:

- Set your desired ratio (e.g. Risk = 1, Reward = 2 for a 1:2 RR)
- The TP level on the chart and in Telegram alerts is calculated from this ratio

A **minimum 1:2 RR** is recommended. Enable the **Min R:R Gate** filter to automatically reject setups that do not meet your threshold.

Step 4 — Enter Your Account Size (Optional but Recommended)

In the **Account Size** section:

- Enter your **account balance** in USD
 - Enter your **risk per trade %** (recommended: 1%)
 - Breakout Indicator Bot will automatically calculate and display:
 - Dollar risk per trade
 - Dollar reward potential
 - Recommended position size (lots)
-

Step 5 — Enable Strategies

In the **Strategies** section, toggle on the strategies you want to run. Each strategy scans independently for its own specific setup. All active strategy signals appear in the Strategy Alerts panel and are sent to Telegram.

(See Section 5 for a full explanation of all 12 strategies.)

Step 6 — Press Connect and Let Breakout Indicator Bot Run

Once connected, Breakout Indicator Bot:

- Starts collecting candles
- Processes each new candle through the 6-phase engine
- Scans all enabled strategies on every candle close
- Displays the live phase, direction, and state in real time

You do not need to do anything else. Watch the chart, wait for signals, and act when you are ready.

Receiving Signals on Telegram

Breakout Indicator Bot sends Telegram alerts automatically when a signal fires. Each alert includes:

- A **1920x1080 screenshot** of the live chart with all indicators and levels drawn
- Signal details: symbol, direction, entry, SL, TP, RR, confluence score
- The strategy or phase that triggered the alert

To receive Telegram alerts, link your Telegram account via the Telegram section in Settings or contact your administrator.

Best Times to Trade Different Markets

Market	Best Timeframe	Best Hours (UTC)
Forex Majors (EUR/USD, GBP/USD)	15m, 1h, 4h	07:00-16:00 (London + NY)
USD/JPY, AUD/USD	15m, 1h	00:00-09:00 (Asian + London)
Gold (XAU/USD)	15m, 1h	07:00-17:00 (London + NY)
Volatility Indices (standard)	5m-1h	24/7
Volatility (1s) indices	1m-5m	24/7
Boom and Crash	1m-15m	24/7
Jump and Step Indices	1m-5m	24/7

Keyboard Shortcuts

Shortcut	Action
Alt+C	Connect
Alt+D	Disconnect
Alt+R	Reset Session
Alt+T	Toggle Theme (Light/Dark)
Alt+E	Export signals to CSV
Alt+P	Export signals to PDF with charts
Alt+N	Toggle notifications
Alt+S	Toggle Stream Mode (hides sensitive info during screen recording)

4. SIGNAL FORMAT EXPLAINED

Sample Telegram Signal

```
=====
      BREAKOUT INDICATOR BOT - POTENTIAL TRADE SETUP
=====
Symbol      : Volatility 75 (1s)
Direction   : BUY
Timeframe    : 1m
-----
Entry       : 12,455.20
Stop Loss   : 12,441.00
Take Profit  : 12,483.40
Risk:Reward : 1:2.0
-----
Confluence  : 11 / 16
Phase       : TRADE
Confirm     : Bullish Engulfing
-----
NOTE: Bullish breakout above 15-min
range. Pin bar retest at 12,450 level.
EMA 8/21 aligned bullish. RSI at 42.
Fib 0.618 confluence at retest zone.
-----
NOT financial advice. Manage your risk.
=====
```

(A full 1920x1080 chart screenshot is attached to every signal)

Breaking Down Each Field

Symbol

The exact market being traded.

Example: "Volatility 75 (1s)" means the 1-second Volatility 75 Index on Deriv.

Direction

- **BUY** — setup favours price moving up. Open a BUY/LONG contract on Deriv.
- **SELL** — setup favours price moving down. Open a SELL/SHORT contract on Deriv.

Timeframe

The chart timeframe the setup was detected on.

- 1m-5m = scalp / very short-term
- 15m-1h = intraday

- 4h-1D = swing trade

Entry

The price at the close of the confirmation candle — this is where Breakout Indicator Bot suggests entering the trade.

Stop Loss (SL)

The price level that defines your risk. If price reaches this level, the trade is considered invalid. Breakout Indicator Bot places the SL at the structural swing low/high of the retest zone, plus an ATR buffer.

Always set your stop loss before opening the trade. This is non-negotiable.

Take Profit (TP)

Your target exit price. Calculated automatically from your R:R setting.

- At 1:2 RR: risk 1 *to make* 2
- At 1:3 RR: risk 1 *to make* 3

Risk:Reward (RR)

How much potential reward relative to the risk taken. Breakout Indicator Bot rejects setups that do not meet your minimum RR threshold (configurable via the Min R:R Gate filter).

Confluence Score

A quality rating from **0 to 16**. Higher means more technical factors confirm the trade. Use this as a priority guide — prefer higher-scored setups when multiple signals are firing.

Confirm Pattern

The specific candlestick pattern that triggered Phase 5 (Confirmation). Examples: Bullish Engulfing, Pin Bar, Morning Star, Inside Bar Breakout.

Note

A plain-language summary of why the setup was identified — which indicators agree, what structure is in place, and any notable conditions.

5. STRATEGIES EXPLAINED — ALL 12 MODULES

Breakout Indicator Bot runs up to 12 independent strategies simultaneously alongside the core breakout-retest engine. Each one looks for a different type of market condition and fires its own alerts. Here is what each strategy does, explained simply.

Strategy 1: Liquidity Sweep

What it looks for: A quick price sweep below a key support level (or above resistance) that immediately reverses — indicating that smart money grabbed stop losses and is now pushing in the opposite direction.

Trade setup: Entry on the reversal candle after the sweep, with a fixed **2:1 Risk:Reward**.

Best for: Experienced traders who understand stop-loss hunting concepts. Works well on Volatility indices.

Strategy 2: Stop Loss Hunt

What it looks for: Price approaching a well-defined S/R level that has been touched 3 or more times, making a sharp spike through it, then quickly reversing. Institutions sweep retail stops before moving the other way.

Trade setup: Entry after the reversal confirmation candle. SL above/below the spike extreme.

Best for: Traders who understand key support/resistance levels.

Strategy 3: Failed Pin Bar

What it looks for: A sequence of 3 or more consecutive strong directional candles (a fear or greed push), followed by a pin bar that appears to signal reversal — but actually fails and resumes the original direction.

Trade setup: Entry in the direction of the original move when the pin bar's reversal breaks down.

Best for: Momentum traders who trade with the trend.

Strategy 4: Fib Golden Zone Scalp

What it looks for: A clear micro-trend on 1-minute charts, a break of structure, then price pulling back into the **0.5-0.618 Fibonacci Golden Zone** — the most statistically powerful retracement area.

Trade setup: Entry at the Fibonacci zone with the target at the previous swing high (uptrend) or swing low (downtrend). Pure price action — no additional indicators.

Best for: Scalpers on 1m charts. Particularly effective on Volatility indices.

Strategy 5: Power of 3 (ICT PO3)

What it looks for: The ICT "Power of 3" concept — three phases that repeat every hour:

1. **Accumulation** — price consolidates near the 1-hour candle open
2. **Manipulation** — a sweep below (bullish day) or above (bearish day) the 1H open to trap retail traders
3. **Expansion** — a strong displacement candle leaving a Fair Value Gap (FVG), followed by a retrace into the FVG for entry

Trade setup: Entry into the Fair Value Gap after the displacement candle. SL below the manipulation low or above the manipulation high. Partial TP at 1R, SL moves to breakeven, let the rest run.

Best for: Intermediate-to-advanced traders familiar with ICT concepts. Best on 15m-1h charts.

Strategy 6: NY Open Range

What it looks for: The 9:30-9:35 AM EST New York open range — the first 5 minutes of the New York session. The strategy monitors for a breakout of this range and a retest, then enters in the breakout direction.

Trade setup: Retest entry with SL inside the range. Tracks wins/losses to show NY session performance.

Best for: Forex traders who trade during the New York session. Best on EUR/USD, GBP/USD, Gold.

Strategy 7: Session Ranges (London Sweep)

What it looks for: Breakout Indicator Bot marks the Asian session range (00:00-09:00 UTC). When the London session opens and price **sweeps** the Asian range high or low with a wick but closes **back inside** — this is the London Sweep, a reliable reversal signal.

Trade setup: Entry on the closing candle that sweeps but closes back inside the Asian range. SL beyond the sweep extreme.

Best for: Forex traders during the London session. Works especially well on tight Asian ranges.

Live Scalp Scanner

What it looks for: A rapid confluence check on every candle, scoring 7 technical conditions simultaneously. When 3 or more conditions align, a scalp alert fires immediately — no waiting for multiple phases.

Signals appear in the LIVE SCALPS ticker banner at the top of the screen.

Best for: Scalpers who want the fastest possible entries. Best on 1m charts and Volatility (1s) indices.

Strategy 8: Grid Scalper MA

What it looks for: Two modes:

- **Price vs MA mode:** BUY when price crosses above a moving average; SELL when it crosses below
- **BOS mode:** BUY when price breaks above a confirmed swing high; SELL below a swing low

Best for: Traders who prefer moving average-based systems or simple break-of-structure trades.

Strategy 9: Fair Value Gap (FVG)

What it looks for:

1. A big push — 3 or more consecutive strong directional candles
2. A Fair Value Gap within that push (a gap between the high of candle 1 and the low of candle 3)
3. Price retesting the origin/demand zone before the push started
4. A Fibonacci discount (price below 50% retracement for buys, above for sells)
5. A confirmation engulfing candle at the zone

Trade setup: Entry at the confirmation candle. SL below/above the demand/supply zone. TP at recent swing.

Best for: Intermediate traders who understand supply/demand zones. Strong on trending markets.

Strategy 11: MTF Top-Down Analysis

What it looks for: Breakout Indicator Bot synthesises higher timeframe candles from your current chart (16x multiplier for "4H" bias, 4x for "1H" setup). It then:

1. Determines the 4H bias (bullish/bearish structure)
2. Finds a 1H consolidation and breakout aligned with that bias
3. Looks for a retest and confirmation on the current timeframe

Trade setup: Entry on the confirmation candle. Minimum 2:1 RR. SL at wick extreme plus ATR buffer.

Best for: Advanced traders who want true multi-timeframe top-down alignment without switching charts.

Strategy 12: Orderblock Detection

What it looks for: An orderblock — the last bearish candle before a strong bullish move, or the last bullish candle before a strong bearish move. These are zones where institutional orders were placed. When price returns to retest these zones, high-probability entries form.

Trade setup: Entry when price retests the orderblock zone with a confirmation pattern.

Best for: Advanced traders who understand institutional order flow and supply/demand.

Tesla 3-6-9 Scaling Model

This optional profit management overlay alerts you at three profit milestones:

Level	R Multiple	Action
T1	3R	Take first partial profit. SL moves to breakeven.
T2	6R	Take second partial profit. Continue running.
T3	9R	Final target or let runner trail.

Two plans available:

- **Conservative (50/30/20):** Take 50% at T1, 30% at T2, 20% at T3
- **Aggressive (25/35/20+trail):** Smaller T1 exit, larger T2 exit, trail the final portion

The chart shows amber T1/T2/T3 horizontal lines so you can visually see your targets.

6. ADVANCED USAGE — THE ANCHOR (POWER USERS)

Reading Market Bias from the State Panel

Open the **State** tab in the left panel. This shows you the live values of every indicator in real time:

State Field	What to Look For
EMA Filter Status	BULL or BEAR — EMA 8 vs 21 crossover direction
HTF Trend	BULL or BEAR — EMA 100 direction (higher-timeframe bias)
ATR	Current volatility level — larger ATR means wider SL needed
Breakout Strength	Candle body vs ATR — how convincing was the breakout
RSI	Current RSI value — ideal retest zone is 35-45 (BULL) or 55-65 (BEAR)
MACD	Above zero = bullish momentum; below = bearish

State Field	What to Look For
ADX	25 or above = trending market; below 20 = ranging
Stochastic	K/D lines — crossover from oversold or overbought
Volatility Regime	TRENDING or RANGING — ADX-based market condition
Signal Strength	Visual gauge showing current confluence score

Power User Rule: Only take trades where EMA Filter, HTF Trend, and your own chart reading all agree on direction.

Mastering the Strategy Filter Toggles

The **Strategy Filters** section gives you 15+ individual toggles to tune the indicator's precision:

Filter	Recommended Setting	Why
Auto-Reset After Trade	ON	Automatically scans for the next setup
EMA 8/21 Trend Filter	ON	Rejects counter-trend breakouts
HTF Trend Filter (EMA 100)	ON	Keeps you aligned with the bigger picture
ATR-Based Tolerance	ON	More accurate retest detection on volatile markets
Trailing Stop	ON for swings	Locks in profit as the trade runs
Partial TP (1:1)	ON for safety	Moves SL to breakeven at 1:1, de-risks the trade
Tesla 3-6-9 Scaling	Optional	For runners — maximises profit on big moves
False Breakout Filter	ON	Invalidates breakouts that close back inside range within 3 candles
Min R:R Gate	ON (set to 2.0)	Automatically rejects low-quality setups
RSI Filter	ON	Ensures price has pulled back enough to have room to move

Filter	Recommended Setting	Why
Volume Spike Filter	ON	Only accepts breakouts with a strong body candle
Session Filter	Optional (Forex only)	Trade Forex only during active sessions
Fibonacci Retest	ON	Adds confluence when retest aligns with fib level
MACD Filter	ON for strong trends	Ensures momentum agrees with the trade
ADX Filter	ON for scalps	Filters out ranging markets

Lock Filters: Once you have your filters set exactly how you want them, tick **Lock Filters** to prevent the auto-apply feature from overriding them when you switch symbols.

Using Multi-Symbol Analysis

Breakout Indicator Bot supports **simultaneous analysis of up to 90 symbols**. To scan multiple markets at once:

1. Open the **Multi-Symbol Analysis** section
2. Tick the symbols you want to monitor
3. Breakout Indicator Bot opens background connections to each selected symbol
4. Signals from any symbol appear in the LIVE SIGNALS ticker banner and trigger Telegram alerts
5. Click any signal in the banner to switch the main chart to that symbol

Power User Tip: Select 5-10 of your most-traded markets instead of all 90. Too many simultaneous connections can slow down your browser.

Position Sizing — Calculated Automatically

Advanced users never guess lot sizes. With Breakout Indicator Bot:

1. Enter your **account balance** in the Account Size section
2. Set your **risk per trade %** (start with 1%)
3. Breakout Indicator Bot calculates exact **position size** (lots) based on your stop loss distance

The formula used:

```
Dollar Risk = Account Balance x Risk %  
Position Size (lots) = Dollar Risk / (SL distance in price x  
contract size)
```

This means every trade risks exactly the same percentage of your account, regardless of how wide the stop loss is.

Using the Confluence Score to Prioritise Signals

When multiple signals fire across different markets or strategies, use the confluence score to prioritise:

Score	Quality	Action
12-16	Excellent	High priority — consider taking
8-11	Good	Solid setup — use with normal risk
4-7	Fair	Lower quality — trade smaller or skip
0-3	Weak	Consider skipping unless strategy-specific

Auto-Trade — How It Works

Auto-Trade places **multiplier contracts** on your Deriv account automatically when a signal fires. To use it:

1. Enter your **Deriv API Token** with trading permissions enabled
2. In the **Auto-Trade** section, toggle on the signal source(s) you want automated:
 - **Breakout-Retest Trades** — core phase-6 signals
 - **Live Scalp Trades** — scalp scanner signals
 - **Strategy Trades** — individual strategy signals (12 sub-toggles)
3. Set your **Base Stake** (starting trade size, minimum \$0.37)
4. Set a **Max Stake** cap (leave blank = 4x base)
5. Set **Multiplier** (contract leverage — default 100)
6. Optionally set a **Session TP** (stop auto-trading after a set dollar profit) and **Session SL** (stop after a set dollar loss)

Compounding: Stake automatically increases after 2 or more consecutive wins and resets to base on a loss.

Safety cut: Auto-trading halts after 3 consecutive losses to protect your account.

CAUTION: Auto-Trade uses real money when connected with a live Deriv account. Fully understand the risks before enabling. Start on a demo account first.

Backtesting Your Settings

Breakout Indicator Bot includes a **backtesting engine** that replays historical candle data through your current settings:

1. Ensure you have candles loaded (connect and wait for history to load)
2. Open the Backtest section in Settings
3. Set the replay speed
4. Press Start — the indicator replays each candle as if it were live
5. Review how many signals fired, how many were wins/losses, and what the confluence scores were

Use backtesting to validate new settings before running them on a live account.

Advanced Signal Interpretation Examples

Example 1 — High-Score Priority:

Two signals fire simultaneously — V75 (1s) BUY with confluence score 14, EUR/USD SELL with score 6. Focus on the V75 signal — it has far stronger technical alignment.

Example 2 — Conflicting Filters:

A BUY signal fires on GBP/USD but the HTF trend (EMA 100) is bearish and ADX shows 17 (ranging market). Two key filters disagree. Skip this trade and wait for better alignment.

Example 3 — Tesla Scaling in Practice:

You enter a BUY on Boom 1000 at 12,000 with SL at 11,985 (15-point risk). $T1 = 3R = 12,045$. When price reaches 12,045, take 50% of your position off and move SL to breakeven (12,000). $T2 = 6R = 12,090$, take another 30%. Let the final 20% run to $T3 = 9R = \$12,135$ or trail it.

7. RISK MANAGEMENT AND RESPONSIBILITY

This section is mandatory reading for all users, regardless of experience level.

Trading Risk — The Reality

Trading financial markets is one of the most rewarding and most risky activities a person can undertake. The potential to grow capital is real — but so is the potential to lose it all. There is no version of trading that eliminates risk. Breakout Indicator Bot reduces guesswork through analysis, but it cannot remove risk from the equation.

Even the best trading systems in the world have losing periods. What determines long-term success is not winning every trade — it is managing risk so that losses are small and wins are larger.

Why Trades Lose Even With Good Signals

- Markets are influenced by millions of participants — no analysis can account for all of them
- Major economic news events can override any technical setup instantly
- Synthetic indices have engineered statistical randomness built into their price generation
- Even a 70% win rate means 3 out of every 10 trades are losses — that is normal

A losing trade does not mean the indicator failed. It means you experienced the natural probability distribution of the market. What matters is your RR ratio — if you risk 1 to make 2 at a 60% win rate, you are mathematically profitable.

The Three Pillars of Risk Management

1. Always Use a Stop Loss

Breakout Indicator Bot always provides a stop loss level. Use it. Always.

- Set your stop loss before confirming the trade
- Never widen your stop loss because the trade is going against you — that turns a small loss into a large one
- Never trade without a stop loss — one unprotected trade can wipe weeks of profit

2. Size Your Position Correctly

Risk a fixed, small percentage of your account on every single trade:

Account Stage	Risk Per Trade
New / Learning	0.5% of account
Developing	1.0% of account
Consistent and Profitable	Up to 2.0% of account

Example: 200accountx12.00 maximum risk per trade.

Use Breakout Indicator Bot's built-in position size calculator — enter account balance and risk % and it does the maths for you.

3. Emotional Discipline

- No revenge trading — after a loss, take a break, return with a clear head
 - No over-trading — quality beats quantity; fewer, better trades beat many mediocre ones
 - No greed — if your TP is hit, close the trade; do not hold for more without a plan
 - No panic — if price moves against you but has not hit your SL, the trade is still valid; do not close early
 - Trust the process — consistent, small risk per trade compounds into significant results over time
-

Why No Signal Is Ever 100% Accurate

Technical analysis works on probabilities. Breakout Indicator Bot identifies setups where the statistical odds favour a particular outcome — but there is always uncertainty. Even a confluence score of 16/16 does not guarantee the trade will win.

Professional traders accept this. They focus on risk:reward and consistency, not on winning every trade.

Client Accountability Statement

By using Breakout Indicator Bot, you acknowledge that all signals and analysis provided are for educational and informational purposes only and do not constitute financial advice. You accept full responsibility for your own trading decisions, including the choice of whether to enter, manage, or exit any trade. Breakout Indicator Bot and its operators cannot be held liable for any losses incurred as a result of acting on signals, alerts, or analysis generated by this indicator. Always trade with money you can afford to lose.

8. LIMITATIONS OF THE INDICATOR

Market Manipulation and Sudden Volatility

Large institutional players (banks, hedge funds, market makers) can move markets in ways that invalidate technical setups. A perfect-looking setup at a support level can be deliberately targeted by institutions to stop-hunt retail traders before the actual move.

Breakout Indicator Bot's Liquidity Sweep and Stop Loss Hunt strategies are specifically designed to identify and trade with these manipulation patterns — but they cannot predict every instance.

News Impact (Forex)

For Forex pairs, major economic news releases cause extreme, sudden price moves that no technical indicator can anticipate:

- US Non-Farm Payrolls (NFP) — first Friday of each month
- Interest rate decisions (Federal Reserve, ECB, Bank of England)
- Inflation data (CPI, PPI)
- GDP releases, geopolitical events

Recommendation: Enable the **Economic Calendar / News Pause** feature in Settings. This automatically pauses signal generation around high-impact news events. Also check **Forex Factory** or **Investing.com** for the daily economic calendar.

Deriv synthetic indices are **not affected by economic news** — they are computer-generated and run 24/7.

Internet and Platform Dependency

Breakout Indicator Bot requires:

- A stable internet connection
- Deriv's WebSocket service to be operational
- Your browser to remain open and active

If your connection drops, Breakout Indicator Bot will attempt to **auto-reconnect** with exponential backoff. During any disconnection, candles and signals may be missed. The current phase will reset on reconnect.

Tip: Use a reliable internet connection. On mobile, prefer WiFi over cellular for sustained sessions.

Single-Symbol Focus

The core breakout-retest engine monitors one symbol at a time. While Multi-Symbol mode allows scanning multiple markets simultaneously, the main chart and detailed state panel always reflect the primary selected symbol.

Why Human Judgment Still Matters

Breakout Indicator Bot is a sophisticated analytical engine — but it is not sentient. It processes numbers and patterns. It does not know:

- Your personal financial situation or risk tolerance
- Whether a news event is about to override the technical picture
- Whether you are having an emotional day
- Whether the market is in an unusual, low-liquidity condition

These are human factors that require human judgment. The indicator provides high-quality technical analysis — you provide the wisdom, context, and final decision.

9. QUICK START SUMMARY

Your one-page guide to getting value from Breakout Indicator Bot today.

Getting Started — 5 Steps

1. **Log in** at `trading.dsitservicesja.com/indicator/` with your credentials
 2. **Paste your Deriv API Token** in the API section (create one at `app.deriv.com` under API Token)
 3. **Select a market** — recommended start: **Volatility 75 (1s)** on the **1-minute** timeframe
 4. **Press Connect** (or Alt+C) — Breakout Indicator Bot begins collecting candles immediately
 5. **Wait for a signal** — when Phase 6 (TRADE) fires, you will see the entry, SL, TP, and confluence score on the chart and receive a Telegram alert
-

How to Get Maximum Value Fast

- **Start on a demo account** — practice the workflow without risking real money
 - **Enable only 2-3 strategies at first** — Liquidity Sweep, Fib Golden Zone, and Live Scalp Scanner are excellent starting points
 - **Set your account balance and risk %** — let Breakout Indicator Bot calculate position sizes for you automatically
 - **Pay attention to confluence scores** — prioritise signals with scores of 8 or above and skip weak setups below 4
 - **Review the State tab before each trade** — confirm EMA Filter and HTF Trend agree with the signal direction
 - **Export your signals weekly** (CSV or PDF) and review what worked — learning from your own trade history is priceless
-

Common Beginner Mistakes to Avoid

Mistake	Why It Hurts	What to Do Instead
Ignoring the confluence score	Low-quality setups have higher failure rates	Prefer scores of 8 or above

Mistake	Why It Hurts	What to Do Instead
Trading without a stop loss	One bad trade can wipe many wins	Breakout Indicator Bot always provides an SL — use it
Over-sizing positions	Losses feel catastrophic and cause panic	Use the 1% rule — let Breakout Indicator Bot calculate for you
Enabling too many strategies at once	Conflicting signals cause confusion	Start with 2-3 strategies
Ignoring HTF trend	Counter-trend trades fail more often	Check the State tab before every entry
Chasing missed signals	Late entries have poor RR	If price has moved past the entry, wait for the next setup
Trading Forex during news	News overrides all technical analysis	Check the economic calendar daily
Enabling Auto-Trade on a live account immediately	Real money at risk before understanding the system	Test on demo for 2 or more weeks first
Turning off filters after losses	Weakens signal quality further	Keep filters on — trust the confluence engine
Judging the system on one week	Too small a sample size	Evaluate over 3-6 months minimum

10. FREQUENTLY ASKED QUESTIONS (FAQ)

Can Breakout Indicator Bot guarantee profits?

No. Breakout Indicator Bot identifies high-probability technical setups based on proven analysis methods. No indicator, system, or analyst can guarantee profits in financial markets. Your profitability depends on how you apply the signals, your risk management discipline, and market conditions.

Is this financial advice?

No. Breakout Indicator Bot provides technical analysis and trade setup identification only. It is not regulated financial advice. All trading decisions are yours alone. If you need personalised financial guidance, consult a licensed financial advisor.

Can complete beginners use Breakout Indicator Bot?

Yes — many beginners find it an excellent learning tool. The 6-phase display teaches you exactly what to look for in a trade. However, beginners should:

- Start on a **demo account**
 - Read this manual in full
 - Enable the **Auto-Apply Recommended** settings feature
 - Start with just the core breakout-retest signals before exploring strategies
-

Can I use it on a small account?

Yes. Breakout Indicator Bot calculates position sizes based on any account size. A 50accounttrading0.50 risk per trade (1%) is just as disciplined as a 5,000account.ITGurusupportsDerivmultipliercontractswit haminimumstakeof0.37, making it accessible at any account size.

Does Breakout Indicator Bot work on Forex or only Deriv synthetics?

Both. Breakout Indicator Bot analyses all Deriv synthetic indices (Volatility, Boom, Crash, Jump, Step) and Forex pairs (majors, crosses, exotics) and commodities (Gold, Silver, Platinum, Palladium) — all within the same interface.

Can results vary from month to month?

Yes. Market conditions change constantly. A trending market produces more clean breakout setups; a choppy, sideways market produces more false breakouts. Evaluate performance over 3-6 months minimum. Short-term results can be misleading in either direction.

What does the confluence score mean?

The confluence score (0-16) measures how many of Breakout Indicator Bot's technical filters agree with the trade direction. A score of 12 means 12 out of 16 conditions align with the setup. Higher scores statistically correlate with stronger setups. Use it to prioritise when multiple signals fire simultaneously.

What is Auto-Trade and is it safe?

Auto-Trade places multiplier contracts on your Deriv account automatically when signals fire. It includes multiple safety mechanisms: compounding resets after losses, auto-halt after 3 consecutive losses, and session P/L limits. That said, real money is at risk — always test on demo first and only enable live auto-trade when you fully understand the system and accept the risk.

How do I know which strategy to use?

Start with the core breakout-retest engine (always active) and Live Scalp Scanner for fast markets. Add Liquidity Sweep and FVG as you grow comfortable. Advanced traders can run all 12 simultaneously and use the confluence score and session filter to prioritise.

What platform do I need?

Breakout Indicator Bot runs entirely in your **web browser** — no downloads or installations required. You need:

- A Deriv account (app.deriv.com)
 - A Deriv API Token (generated in your Deriv account settings)
 - A modern browser (Chrome, Firefox, Edge — latest version recommended)
 - A stable internet connection
-

What if Breakout Indicator Bot disconnects mid-session?

Breakout Indicator Bot will automatically attempt to reconnect using exponential backoff. The current phase resets on reconnect and candle history is reloaded. To manually reconnect at any time, press the **Connect** button in the top bar.

Thank you for choosing Breakout Indicator Bot. We are committed to providing you with the most powerful, precise, and transparent trading indicator available.

Trade smart. Manage your risk. Stay consistent.

FINAL DISCLAIMER: All content in this manual is for educational and informational purposes only. Breakout Indicator Bot is a technical analysis tool, not financial advice. Trading CFDs, Forex, and synthetic indices involves significant risk of loss and is not suitable for all investors. Never trade with funds you cannot afford to lose. Past signal performance is not indicative of future results.
